10 Point Baghouse Inspection Program

# IAC

INDUSTRIAL ACCESSORIES COMPANY

## HAS YOUR BAGHOUSE REALLY BEEN INSPECTED LATELY?

- Has your bag life recently declined?
- Is your baghouse causing unscheduled production downtime?
- Is baghouse maintenance turning into costly “overtime” work for your staff?
- Do your people hate or refuse going into your baghouse due to the nature of the work?
- Do your workers sometimes omit other maintenance items after changing bags, such as checking seals and checking for proper operation of the cleaning system?
- Have emissions from your collector recently become a problem?

If you answered “yes” to any of these questions, then the solution might be a regular 10-Point Inspection by our experienced baghouse technicians. Our crews perform the following on each collector:

1. Inspect the tubesheet for dust accumulation, which indicates a leaking bag, leaking bag / tubesheet connection, or crack in the tubesheet / cellplate seams.
2. Visually inspect for evidence of dust leakage. A Detekto-Lite Leak Detection Test can be run if needed. This test identifies specific points of leakage. (Requires access to the clean air plenum.)
3. Visually inspect general condition of bags and cages for obvious signs of deterioration.
4. Inspect the cleaning system and identify components in need of repair or replacement.
5. Inspect the housing for points of in-leakage and note areas in need of repair.
6. Inspect the tubesheet or cellplates for areas of corrosion or deterioration.
7. Inspect the hopper, if accessible, noting any areas of build-up.
8. Inspect the inlet baffle plate for wear and note any needed repairs.
9. Inspect the door seals for leakage and note any needed repairs.
10. Provide a written report on the status of the unit and determine future required repairs.
